Background	IL-3 is a pleiotropic cytokine of the interleukin family, mainly produced by activated T cells and also by mast cells and eosinophils in some contexts. It binds to the IL-3 receptor complex (IL-3Rα/CSF2RB) on hematopoietic progenitor cells, promoting the survival, proliferation, and differentiation of multiple myeloid lineages in hematopoiesis. In summary, IL-3 is a key hematopoietic growth factor with biomarker and therapeutic potential in bone marrow failure, allergic inflammation, and hematological malignancies.
