Background	Melanotransferrin is a protein that in humans is encoded by the MELTF gene. MELTF has also recently been designated CD228 (cluster of differentiation 228). The protein encoded by this gene is a cell-surface glycoprotein found on melanoma cells. The protein shares sequence similarity and iron-binding properties with members of the transferrin superfamily. The importance of the iron binding function has not yet been identified. This gene resides in the same region of chromosome 3 as members of the transferrin superfamily. Alternative splicing results in two transcript variants. It is part of neural crest tissue, often present in melanotic neuroectodermal tumor of infancy.
