Product Sheet

H_cMET HEK-293(cMET KO) Cell Line

Catalog number: GM-C36567

Version 3.3.1.250630

cMET (also known as MET or HGFR) is a receptor tyrosine kinase that belongs to the hepatocyte growth factor (HGF) receptor family. cMET typically leads to the formation, progression, and metastasis of cancer by promoting cell movement, assisting tumor cells in crossing tissue gaps and entering the bloodstream.

H_cMET HEK-293(cMET KO) cell line is a clonal stable HEK-293 cell line that expresses the codon-optimized cMET gene after knocking out the endogenously expression of cMET. By precisely controlling the expression of cMET, it allows for the clarification of its specific functions in cell biology and can be used to study the role of cMET in tumorigenesis and progression, as well as for screening cancer drugs.

Quantity	5E6 Cells per vial,1 mL
Product Format	1 vial of frozen cells
Shipping	Shipped on dry ice
Storage Conditions	Liquid nitrogen immediately upon receipt

Target	Human_cMET
Gene ID/Uniprot ID	P08581-1
Host Cell	HEK-293

Recovery Medium	DMEM+10% FBS+1% P.S
Growth medium	DMEM+10% FBS+1% P.S+125 μg/mL Hygromycin
Note	The cells are very sensitive to antibiotics and should be cultured using the cell growth medium provided by Genomeditech.These cells are constructed based on cMET knockout parent cells, which contain Blasticidin and Puromycin resistance genes.
Freezing Medium	90% FBS+10% DMSO
Growth properties	Adherent
Growth Conditions	37°C, 5% CO_2

Mycoplasma Testing	The cell line has been screened to confirm the absence of Mycoplasma species.
Safety considerations	Biosafety Level 2
Note	It is recommended to expand the cell culture and store a minimum of 10 vials at an early passage for potential future use.

Materials

Reagent	Manufacturer/Catalogue No.
DMEM	Gibco/C11995500BT
Fetal Bovine Serum	ExCell/FSP500
Pen/Strep	Thermo/15140-122
Hygromycin	Genomeditech/GM-040403
Anti-H_HGFR(Met) hIgG4 Antibody(Emibetuzumab)	Genomeditech/GM-28859AB

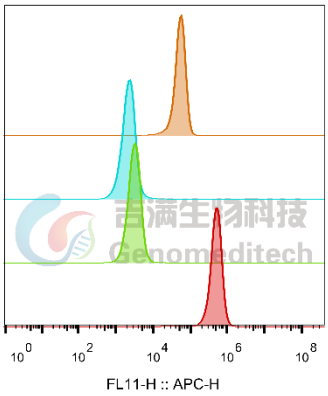
Figures



SampleID	Geometric Mean : FL11-H
HEK-293 anti-Met+APC-2nd Ab	50916
HEK-293 cMET KO anti-Met+APC-2nd Ab	2216
HEK-293 H_cMET (cMET KO) H_IgG+APC-2nd Ab	3124
HEK-293 H_cMET (cMET KO) anti-Met+APC-2nd Ab	4.60E5

Figure 1 | H_cMET HEK-293(cMET KO) Cell Line (Cat. GM-C36567) was determined by flow cytometry using Anti-H_HGFR(Met) hIgG4 Antibody(Emibetuzumab) (Cat. GM-28859AB).

Figure 2 | The Sanger sequencing of the parent cells showed that the endogenously expression of cMET has been knocked out.

Cell Recovery

Recovery Medium: DMEM+10% FBS+1% P.S

To insure the highest level of viability, thaw the vial and initiate the culture as soon as possible upon receipt. If upon arrival, continued storage of the frozen culture is necessary, it should be stored in liquid nitrogen vapor phase and not at -70°C. Storage at -70°C will result in loss of viability.

a) Thaw the vial by gentle agitation in a 37°C water bath. To reduce the possibility of contamination, keep the O-ring and cap out of the water. Thawing should be rapid (approximately 2 - 3 minutes).

b) Remove the vial from the water bath as soon as the contents are thawed, and decontaminate by dipping in or spraying with 70% ethanol. All of the operations from this point on should be carried out under strict aseptic conditions.

c) Transfer the vial contents to a centrifuge tube containing 5.0 mL complete culture medium and spin at approximately 176 x g for 5 minutes. Discard supernatant.

d) Resuspend cell pellet with the recommended recovery medium. And dispense into appropriate culture dishes.

Email: service@genomeditech.com

e) Incubate the culture at 37°C in a suitable incubator. A 5% CO_2 in air atmosphere is recommended if using the medium described on this product sheet.

Cell Freezing

Freezing Medium: 90% FBS+10% DMSO

a) Centrifuge at 176 x g for 3 minutes to collect cells.

b) Resuspend the cells in pre-cooled freezing medium and adjust the cell density to 5E6 cells/mL.

c) Aliquot 1 mL into each vial.

d) Place the vial in a controlled-rate freezing container and store at -80°C for at least 1 day, then transfer to liquid nitrogen as soon as possible.

Cell passage

Growth medium: DMEM+10% FBS+1% P.S+125 μg/mL Hygromycin

For the first 1 to 2 passages post-resuscitation, use the recovery medium. Once the cells have stabilized, switch to a growth medium.

a) Subculturing is necessary when the cell density reaches 80%. It is recommended to perform subculturing at a ratio of 1:3 to 1:4 every 2-3 days. Ensure that the density does not exceed 80%, as overcrowding can lead to reduced viability due to compression.

b) Remove and discard culture medium.

c) Briefly rinse the cell layer with PBS to remove all traces of serum that contains trypsin inhibitor.

d) Add 1.0 mL of 0.25% (w/v) Trypsin-EDTA solution to dish and observe cells under an inverted microscope until cell layer is dispersed (usually within 30 to 60 seconds at 37°C).

e) Note: To avoid clumping do not agitate the cells by hitting or shaking the flask while waiting for the cells to detach. Cells that are difficult to detach may be placed at 37°C to facilitate dispersal.

f) Add 2.0 mL of growth medium to mix well and aspirate cells by gently pipetting.

g) After centrifugation, resuspend the pellet and add appropriate aliquots of the cell suspension to new culture vessels.

h) Incubate cultures at 37°C.

Subcultivation Ratio: A subcultivation ratio of 1:3 - 1:4 is recommended

Medium Renewal: Every 2 to 3 days

Notes

a) Upon initial thawing, a higher number of dead cells is observed, which is a normal phenomenon. Significant improvement is seen after adaptation. Once the cells reach a stable state, the number of dead cells decreases after subculturing and the cell growth rate becomes stable.

b) Ensure that the cell density does not exceed 80%, as overcrowding may lead to reduced viability due to compression.
